The authors call the conventional wisdom into question by making four claims: (1) the activities targeted by industrial policy are increasingly governed by decentralized production networks rather than markets or hierarchies, (2) “network failures” are therefore no less threatening to industrial dynamism than market or organizational failures, (3) the spatial and organizational decentralization of production have simultaneously increased the demand and broadened the support for American ...

The proper role of government in the US economy has long been the subject of ideological dispute. This study of industrial policy as practised by administration after administration, explores the variations from a hands-off approach to protectionist policies and aggressive support for businesses.

In contrast to what observers have frequently argued, this timely and thought provoking book suggests that the concept of industrial policy is not alien to the American past and present. The debate on this topic in the US has always been full of contradictory rhetoric and policy practices, and the expert authors therefore acknowledge a need to rethink the traditional antagonist positions. They illustrate that contemporary markets continue to demand to be fixed by government policies, and governments continue to show how fixing-the-market policies might fail. The conclusion is that the future of industrial policy is about how to make both markets and governments better in their functioning, but that the real goal for industrial policy is to make better-market and better-government policies consistent with the goal of building a better society. Affirming that it is time to break the taboo and discuss the nation's goals, targets, and tools to develop a new, effective American industrial policy, this pathbreaking book will prove a thought provoking and challenging read for students, academics and policymakers with an interest in political economy and industrial policy, public sector and international economics.

This book argues that digital globalization is inducing deep and productive transformations, making industrial policy necessary in order to reorientate development towards inclusive and more sustainable growth. The book also demonstrates that industrialization remains an important development process for emerging countries. Regarding the future of jobs, the authors show how the substitution of labour in automation is not inevitable since technology is also complementary to human capital. Policymakers should pay more attention to the new skills that will be required. A particular concern is is the rapid change in technology and business compared to institutions which take time to adapt. Territories have an important role to play in order to speed-up institutional adaptation, providing they can act coherently with the other levels of government.

In the aftermath of the global financial crisis and the ensuing recession, economic debate has begun to shift towards 'rebalancing' the UK economy, away from an over-reliance upon consumerism and the financial sector to generate growth, towards more sustainable productive activities. The fallout from the crisis exposed systemic failings to deliver balanced growth, and there is now increasing recognition that this 'rebalancing' might best be achieved through the state pursuing an active 'industrial policy'. This book offers a broad set of perspectives on the many facets of industrial policy.

This book examines the American industrial strategy, from the late 70s to the present day, in what is now known as the 'neoliberal era'. The author illustrates the ways in which the protection and promotion of American companies and industries took place in the context of the international 'free market'. He provides clear evidence of how the economic power of the United States - wielded to influence the formal and informal institutions of the neoliberal order - has been used as a tool for enhancing its competitive advantage against other world economies.
